                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises the amino acid and coding sequence of the histone acetyl transferase 21.67 protein. The DNA and protein sequences of the invention are useful for the treatment of malignant tumours, haemopathy, HIV infection, immunological diseases and various inflammations. The process of the acetyl transferase are the acetyl transferase are the acetyl transferase.

                                                                                                                                                                                         The invention relates to a DNA (I) that shows increased or decreased expression during biosynthesis of cell wall components or formation of wood fibre cells in a plant, comprising a nucleotide sequence that hybridises under stringent conditions with any of 1731 fully defined sequences (S1) of 60 nucleotides given in specification, or with a nucleotide sequence encoding a protein having 50% or more homology with that encoded by (S1). Also included in the specification are: (a) a promoter DNA (II) of (I); (b) a DNA comprising a nucleotide sequence that is complementary to (I) or nucleotide sequence that codes RNA, which suppresses the expression of (II by RNA interference effect or the cosuppression effect; (c) a recombinant vector (III) comprising (II); (d) a microorganism comprising (III); (e) a transformed print cell (IV) comprising (III); are areas and (f) a transformed print of (V) obtained from (IV).
                                                                                                                                                   (I) are useful for regulating biosynthesis of cell wall components or morphological formation of wood fibre cells. This sequence corresponds an expressed sequence tag (EST) fragment relating to the DNA of the
                                                                                                            Sequence 60
                                                                                                                                                                                                                                                                                                                                                                                                                      New genes specifically expressed in eucalyptus wood forming tissues, useful in controlling biosynthesis of cell wall components and morphological formation of wood fiber cells.

                                                                                                                                                                                                                                                                                                                                      The invention discloses a microarray comprising a plurality of nucleic caid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch antisense match or antisense mismatch. CC Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, city in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridisation probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, cor family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence of the sequence of the sequence and slob be obtained in electronic format directly

Sequences AAA06974-A07013 represent antisense oligonucleotides targetted CC to the human Smad5 gene, which inhibit its expression. The antisense CC oligonucleotides were designed to target different regions of the human CC Smad5 RNA, and were analysed for their effect on Smad5 mRNA levels by CC quantitative real-time PCR. The Smad proteins are a family of cytosolic proteins which are involved in TGF-beta superfamily signal transduction. CC On ligand binding, TGF-beta superfamily proteins (such as bone morphogenetic protein (BNP), activin and TGF-betas themselves) CC phosphorylate Smad proteins, which then homo- or heterodimerise and CC translocate to the nucleus to activate target gene transcription. Smad5 CC (also known as MADH5, Dwarfin-C and JV5-1) is a member of the subgroup of CC Smad family transcription factors which mediate signal transduction from CC SMPs. Smad5 is activated by BNP-2 through the BNP type Ia or Ib CC (US6013787; AN769622) and translocate to the nucleus. The antisense CC oligonucleotides of the invention are useful for diagnosis, prevention CC and treatment of conditions associated with Smad5 expression, such as CC tumour formation, inflammation and certain infections

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAA89127 standard; DNA; 33
This oligonucleotide, termed orf4-L for, is used as forward primer, withe reverse primer given in AAA89128, for the PCR amplification of ORF lipoprotein of a Neisseria sp. The PCR product was used in expression purification experiments, and can be used as 1 component of novel
                                                                                                                                                                                                                                                                                                                                                                                                                                              Giuliani
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       19-MAY-2000; 2000WO-IB000828

                                                                      forward primer, wit mplification of ORF4
```

The invention relates to methods for the heterologous expression of Neisserial proteins from Neisseria meningitidis and Neisseria gonorrhoeae. At least one domain in the protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 953, 961 and 983. Sequences AAS43807-AAS43867 and AAS43906-AAS44358 represent PCR primers used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                combination compositions of the invention. These compositions comprise: (i) 2 or more Neisserial proteins, (ii) 2 or more different Neisserial nucleic acids; or (iii) mixtures of 1 or more Neisserial protein and 1 or more Neisserial nucleic acid. The proteins and nucleic acids are preferably from different Neisseria spp., especially Neisseria meningitidis and Neisseria gonorrhoeae, but may be from the same species, or from different serogroups or strains of the same species. The compositions are used e.g. as immunogenic compositions, vaccines or diagnostic reagents. They are used to treat or prevent Neisserial infection, to detect the presence of Neisserial bacteria or of antibodies raised against Neisserial bacteria, and/or as reagents which can raise

The recombinant microorganism and method are useful for producing a protein or polypeptide of interest or substances, e.g. food, antibiotics, sugars, or lipids. The present sequence represents a Bacillus PCR primer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to detect the specific F. tularensis nuclectide sequence, especially using a fluorogenic 5' nuclease PCR assay. The invention provides different primer/probe sets for different loci on the F. tularensis genome. Also provided is a method for identifying F. tularensis by analysing samples taken from monitoring devices, such as air monitors for nucleotide sequences that are specific to the bacterium. As the nucleotide sequences are unique to F. tularensis, the primers/probes provide a more reliable method of detection than existing methods, reducing the occurrence of false positive and false negative results.
            Novel antisense compounds useful for inhibiting the in human cells or tissues and treating inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of a hybridisation probe for a specific Francisella tularensis nucleotide sequence ADK67816 that serves as a marker or signature for identification of the bacterium. F. tularensis the causative agent of tularaemia and a potential weapon of mass destruction and instrument of terror. A PCR forward primer ADK67813, reverse primer ADK67814 and the present hybridisation probe can be used

HDAC2 also known as HDAC-2, hdac2, human RPD3 and hRPD3. The composition comprises antisense compounds that can be targeted towards HDAC2. The compound is useful for preparing a composition for treating hyperproliferative disorders, e.g., cancer. It is also useful in antisense gene therapy. The present sequence is human HDAC2 DNA target region. Human HDAC2 gene is located at chromosome 6q21.
                                                                                     antisense;
                                                                                                                                          Histone deacetylase 2; HDAC2; HDAC-2; hdac2; RPD3; hRPD3;
                                                                                                                                                                                                    Human
                                                                                                                                                                                                                                                            15-JUL-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New compound, having a sequence targeted to a coding region of a nucleic acid encoding human histone deacetylase 2, useful for preparing a composition for treating hyperproliferative disorders, e.g., cancer.
                                                                                                                  hyperproliferative

HDAC2 is also known as HDAC-2, hdac2, human RPD3 and hRPD3. The composition comprises antisense compounds that can be targeted towards HDAC2. The compound is useful for preparing a composition for treating hyperproliferative disorders, e.g., cancer. It is also useful in antisense gene therapy. The present sequence is an antisense oligonucleotide targeted to human HDAC2 DNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ADJ27026
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         modified_base
                                                                                                                                                                                                                                New antisense oligonucleotide compound, useful for diagnosing, preve and/or treating conditions with aberrant activity of the histone deacetylase 2, such as cancer, inflammation and metabolic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       14-JUN-2002; 2002US-00173192
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthetic
The present invention relates to antisense compounds, compositions and methods used for modulating histone deacetylase 2 (HDAC2). The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of histone deacetylase 2, such as a hyperproliferative disorder (cancer), a condition involving an inflammatory response or an aberrant apoptosis and a metabolic disorder
                                                                                                                                                                                                                                                                                                                                                                                Monia BP,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention is also useful in antisense-therapy. The present sequence is human histone deacetylase 2 DNA antisense oligonucleotide used in the exemplification of the invention.
                                                                                   The present invention relates to antisense compounds, compositions and methods used for modulating histone deacetylase 2 (HDAC2). The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of histone deacetylase 2, such as a hyperproliferative disorder (cancer), a condition involving an inflammatory response or an aberrant apoptosis and a metabolic disorder The invention is also useful in antisense-therapy. The present sequence is human histone deacetylase 2 target DNA fragment used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense oligonucleotide compound, useful for diagnosing, p and/or treating conditions with aberrant activity of the histone deacetylase 2, such as cancer, inflammation and metabolic disord
                                                                                                                                                                                                                                                                                                                                                                                            Example 15; SEQ ID NO 67; 46pp; English.

                         interference. Also disclosed are an expression vector comprising a nucleic acid sequence encoding an siNA molecule; and a mammalian cell comprising the expression vector. The siNA molecule (I) is useful for modulating the expression. It is also useful for modulating the expression and activity of other genes in the pathways of RAS. The siNA molecule is also useful for diagnosing or treating diseases and conditions that respond to the modulation of RAS gene expression or
                                                                                                                                                                                                                                                                           The invention describes a chemically synthesized double stranded short interfering nucleic acid (siNA) molecule (I) that directs cleavage of a RNA via RNA interference (RNAi), where each strand of the siNA molecule is 18-23 nucleotides in length, and one strand of the siNA molecule comprises nucleotide sequence complementary to the N-RAS RNA the siNA molecule to direct cleavage of the N-RAS RNA via RNA in the sinA molecule to direct cleavage of the N-RAS RNA via RNA
       activity, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New chemically synthesized double stranded short interfering nucleic acid molecule that directs cleavage of N-RAS RNA via RNA interference, useful for modulating RAS gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           16-APR-2004;

interference. Also disclosed are an expression vector comprising a nucleic acid sequence encoding an sinA molecule; and a mammalian cell comprising the expression vector. The sinA molecule (I) is useful for modulating RAS gene expression. It is also useful for modulating the expression and activity of other genes in the pathways of RAS. The sinA molecule is also useful for diagnosing or treating diseases and conditions that respond to the modulation of RAS gene expression or activity, e.g. cancer or other proliferative diseases, disorders, or conditions. This sequence represents a human N-Ras siRNA target sequence
                                                                                                                       The invention describes a chemically synthesized double stranded short interfering nucleic acid ($iNA) molecule (I) that directs cleavage of an example of the sina molecule is 18-23 nucleotides in length, and one strand of the sina molecule comprises nucleotide sequence complementary to the N-RAS RNA the sina molecule to direct cleavage of the N-RAS RNA via RNA the sina molecule to direct cleavage of the N-RAS RNA via RNA
                                                                                                                                                                                                                                              New chemically synthesized double stranded molecule that directs cleavage of N-RAS RNZ for modulating RAS gene expression.
                                                                                                                                                                                                                     Claim 33; SEQ ID NO 363; 204pp; English.

The present invention relates to antisense compounds, compositions and methods used for modulating histone deacetylase 2 (HDAC2). The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of histone deacetylase 2, such as a hyperproliferative disorder (cancer), a condition involving an inflammatory response or an aberrant apoptosis and a metabolic disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Key

The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at http://dbsgap.versailles.inra.fr/publiclines/. This sequence has been generated in the framework of the French plant genomics program 'Genoplante' (http://www.genoplante.com and http://genoplante-info.infobiogen.fr).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            25
